Introduction

We solve the Quadratic Torsion Challenge for B = 800.

 $X_1(13)$ and $X_1(18)$

Basic idea

Introduction

Basic idea

• Combine several necessary conditions for $X^d(\mathbb{Q})$ to be nonempty.

Introduction

Basic idea

• Combine several necessary conditions for $X^d(\mathbb{Q})$ to be nonempty. This reduces the list of ds. For the remaining ds:

Introduction

Basic idea

- Combine several necessary conditions for $X^d(\mathbb{Q})$ to be nonempty. This reduces the list of ds. For the remaining ds:
- Search for points;

Introduction

Basic idea

- Combine several necessary conditions for $X^d(\mathbb{Q})$ to be nonempty. This reduces the list of ds. For the remaining ds:
- Search for points:
- If none found, try using Mordell-Weil sieve to prove there are none.

Introduction

Basic idea

- Combine several necessary conditions for $X^d(\mathbb{Q})$ to be nonempty. This reduces the list of ds. For the remaining ds:
- Search for points;
- If none found, try using Mordell-Weil sieve to prove there are none.

We're only going to show $X_1(13)$ because the two cases are basically identical.

ELS

Introduction

Lemma

If $X_1^d(13)(\mathbb{Q}) \neq \emptyset$, then it is everywhere locally soluble.

Krumm's filter

Introduction

Theorem (Krumm, 2013)

If $X_1^d(13)(\mathbb{Q}) \neq \emptyset$, and $d \neq -3$, then

- **1** d > 0:

First a preparatory lemma.

Introduction

First a preparatory lemma.

Lemma

For every quadratic field K, we have

$$J_1(13)(K)_{tors} = J_1(13)(\mathbb{Q})_{tors} \cong \mathbb{Z}/19\mathbb{Z}.$$

Introduction

First a preparatory lemma.

Lemma

For every quadratic field K, we have

$$J_1(13)(K)_{tors} = J_1(13)(\mathbb{Q})_{tors} \cong \mathbb{Z}/19\mathbb{Z}.$$

Proof.

For $p \ge 5$, $p \ne 13$, the torsion subgroup $J_1(13)(K)_{tors}$ injects into $J_1(13)(\mathbb{F}_{p^2}).$

Introduction

First a preparatory lemma.

Lemma

For every quadratic field K, we have

$$J_1(13)(K)_{tors} = J_1(13)(\mathbb{Q})_{tors} \cong \mathbb{Z}/19\mathbb{Z}.$$

Proof.

For $p \ge 5$, $p \ne 13$, the torsion subgroup $J_1(13)(K)_{tors}$ injects into $J_1(13)(\mathbb{F}_{p^2})$. By computing this latter group for p=5 and 7, one sees that it must be a subgroup of $\mathbb{Z}/19\mathbb{Z}$.

Introduction

First a preparatory lemma.

Lemma

For every quadratic field K, we have

$$J_1(13)(K)_{tors} = J_1(13)(\mathbb{Q})_{tors} \cong \mathbb{Z}/19\mathbb{Z}.$$

Proof.

For $p \ge 5$, $p \ne 13$, the torsion subgroup $J_1(13)(K)_{tors}$ injects into $J_1(13)(\mathbb{F}_{p^2})$. By computing this latter group for p=5 and 7, one sees that it must be a subgroup of $\mathbb{Z}/19\mathbb{Z}$. OTOH, the torsion over \mathbb{Q} is $\mathbb{Z}/19\mathbb{Z}$.

Introduction

Let $K = \mathbb{Q}(\sqrt{d})$. If $X_1(13)(K) \neq X_1(13)(\mathbb{Q})$, then $J_1(13)(K)$ and hence $J_1^d(13)(\mathbb{Q})$ has positive rank.

Introduction

Let $K = \mathbb{Q}(\sqrt{d})$. If $X_1(13)(K) \neq X_1(13)(\mathbb{Q})$, then $J_1(13)(K)$ and hence $J_1^d(13)(\mathbb{Q})$ has positive rank.

Proof.

If P is a K-point of $X_1(13)$ that is not a \mathbb{Q} -point,

Introduction

Let $K = \mathbb{Q}(\sqrt{d})$. If $X_1(13)(K) \neq X_1(13)(\mathbb{Q})$, then $J_1(13)(K)$ and hence $J_1^d(13)(\mathbb{Q})$ has positive rank.

Proof.

If P is a K-point of $X_1(13)$ that is not a \mathbb{Q} -point, then it embeds under the Abel-Jacobi map to a K-point of $J_1(13)$ that is not a \mathbb{Q} -point.

Introduction

Let $K = \mathbb{Q}(\sqrt{d})$. If $X_1(13)(K) \neq X_1(13)(\mathbb{Q})$, then $J_1(13)(K)$ and hence $J_1^d(13)(\mathbb{Q})$ has positive rank.

Proof.

If P is a K-point of $X_1(13)$ that is not a \mathbb{Q} -point, then it embeds under the Abel-Jacobi map to a K-point of $J_1(13)$ that is not a \mathbb{Q} -point. Therefore by the previous lemma it must be of infinite order.

Introduction

Let $K = \mathbb{Q}(\sqrt{d})$. If $X_1(13)(K) \neq X_1(13)(\mathbb{Q})$, then $J_1(13)(K)$ and hence $J_1^d(13)(\mathbb{Q})$ has positive rank.

Proof.

If P is a K-point of $X_1(13)$ that is not a \mathbb{Q} -point, then it embeds under the Abel-Jacobi map to a K-point of $J_1(13)$ that is not a \mathbb{Q} -point. Therefore by the previous lemma it must be of infinite order. The final part comes from $\operatorname{rk}(J_1(K)) = \operatorname{rk}(J_1(\mathbb{Q})) + \operatorname{rk}(J_1^d(\mathbb{Q})).$

Corollary

Introduction

If $X_1^d(13)(\mathbb{Q}) \neq \emptyset$, then $J_1^d(13)$ has positive \mathbb{Q} -rank.

How to efficiently determine positive rank?

Determining whether the Jacobian of a modular curve has positive analytic rank or not can be done efficiently via a modular symbols computation involving the twisted winding element, a method that goes back to Johan Bosman's PhD thesis.

 $X_{1}(13)$ and $X_{1}(18)$

Introduction

Johan Bosman

How to efficiently determine positive rank?

Determining whether the Jacobian of a modular curve has positive analytic rank or not can be done efficiently via a modular symbols computation involving the twisted winding element, a method that goes back to Johan Bosman's PhD thesis.

Introduction

Johan Bosman

CHAPTER 2. COMPUTATIONS WITH MODULAR FORMS

The element $\sum_{\nu=0}^{l-1} \chi(-\nu) \{\infty, \frac{\nu}{\ell}\}$ of $\mathbb{M}_k(\Gamma_1(N)) \otimes \mathbb{Z}[\chi]$ or of some other modular symbols space where it is well-defined is called a twisted winding element or, more precisely the Y-twisted winding element. Because of formula (2.7), we can calculate the pairings of newforms in $S_2(\Gamma_1(N))$ with twisted winding elements quite efficiently as well.

```
def is_rank_of_twist_zero(G, d):

    M = ModularSymbols(G)
    S = M.cuspidal_subspace()
    phi = S.rational_period_mapping()
    chi = kronecker_character(d)
    w = phi(M.twisted_winding_element(0, chi))
    return w != 0
```

and hence view C as a subvariety of J.

Fix $n \ge 1$. Define the map

$$\pi: J \hookrightarrow J$$
$$Q \mapsto nQ + P.$$

The pullback $\pi^*(C)$ yields an unramified cover that has a rational point mapping to P.

Introduction

An *n*-cover is any unramifed cover geometrically isomorphic to one of the above form. Equivalently, it is an unramified cover D/C over K such that

$$\operatorname{\mathsf{Aut}}_{\overline{K}}(D/C)\cong J[n](\overline{K})$$

as $Gal(\overline{K}/K)$ -modules.

Introduction

An *n*-cover is any unramifed cover geometrically isomorphic to one of the above form. Equivalently, it is an unramified cover D/C over K such that

$$\operatorname{\mathsf{Aut}}_{\overline{K}}(D/C)\cong J[n](\overline{K})$$

as $Gal(\overline{K}/K)$ -modules.

Write $Cov^{(n)}(C/K)$ for the set of isomorphism classes of *n*-covers of *C*.

Introduction

Write $Sel^{(n)}(C/K) \subseteq Cov^{(n)}(C/K)$ for the set of ELS *n*-covers. This is a finite set.

Since a curve with a rational point admits a globally soluble *n*-cover, and hence an ELS *n*-cover,

Introduction

An *n*-cover is any unramifed cover geometrically isomorphic to one of the above form. Equivalently, it is an unramified cover D/C over K such that

$$\operatorname{Aut}_{\overline{K}}(D/C) \cong J[n](\overline{K})$$

as $Gal(\overline{K}/K)$ -modules.

Write $Cov^{(n)}(C/K)$ for the set of isomorphism classes of *n*-covers of *C*.

Write $Sel^{(n)}(C/K) \subseteq Cov^{(n)}(C/K)$ for the set of ELS *n*-covers. This is a finite set.

Since a curve with a rational point admits a globally soluble *n*-cover, and hence an ELS *n*-cover,

$$\mathsf{Sel}^{(n)}(C/K) = \emptyset \Rightarrow C(K) = \emptyset$$

We now set n = 2.

We now set n = 2. Bruin and Stoll define a quotient of $Sel^{(2)}(C/K)$, called the fake 2-Selmer set $Sel_{fake}^{(2)}(C/K)$ for which the above all still applies.

We now set n=2. Bruin and Stoll define a quotient of $Sel^{(2)}(C/K)$, called the fake 2-Selmer set $Sel^{(2)}_{fake}(C/K)$ for which the above all still applies. This is good because $Sel^{(2)}_{fake}(C/K)$ can be algorithmically and explicitly constructed.

Nils Bruin

Michael Stoll

This gives us a way to compute the fake Selmer-set explicitly. **define** FakeSelmerSet(f):

1. A := k[x]/(f(x))

- 2. Let S be the set of primes of k described above.
- 3. **if** $2 \mid \deg(f)$:
- 4. G := A(2,S)/k(2,S)
- 5. else:

Introduction

- 6. G := A(2, S)
- 7. $W := \{g \in G : N_{A/k}(g) \in f_n k^{*2} \}$. if $W = \emptyset$: return \emptyset
- 8. $T := S \cup$ "small" primes, as in Lemma 4.3
- 9. for $p \in T$:
- $A_p := A \otimes k_p; H'_p := A_p^*/A_p^{*2}.$ 10.
- $W_p' := \mathsf{LocalImage}(f_p) \subset H_p'$ or, if $p \mid \infty$, use Section 5 to compute W_p' . 11.
- 12. if $2 \mid \deg(f)$:
- $H_p := H_p'/k_p^*$; $W_p := \text{image of } W_p' \text{ in } H_p$ 13.
- 14. else :
- 15. $H_p := H'_p; W_p := W'_p$
- 16. Determine $\rho_p: G \to H_p$.
- $W := \{ w \in W : \rho(w) \in W_n \}.$
- 18. return W

Corollary

Introduction

If $X_1^d(13)(\mathbb{Q}) \neq \emptyset$, then the fake 2-Selmer set is nonempty.

17, 113, 193, 313, 481, 673, 1153, 1417, 1609, 1921, 2089, 2161, 2257, 3769, 3961, 5449, 6217, 6641, 8473, 8641, 9689, 9881

Out of these values, we search for points;

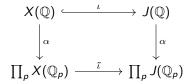

Out of these values, we search for points; this then leaves the following list where it is likely that they don't have rational points:

673, 1609, 1921, 2089, 2161, 8473, 8641, 9689

Out of these values, we search for points; this then leaves the following list where it is likely that they don't have rational points:

673, 1609, 1921, 2089, 2161, 8473, 8641, 9689

These are dealt with via the Mordell-Weil sieve.

Introduction

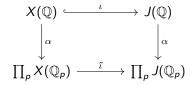

$$X(\mathbb{Q}) \stackrel{\iota}{\longleftarrow} J(\mathbb{Q})$$

$$\downarrow^{\alpha} \qquad \qquad \downarrow^{\alpha}$$

$$\prod_{\rho} X(\mathbb{Q}_{\rho}) \stackrel{\tilde{\iota}}{\longrightarrow} \prod_{\rho} J(\mathbb{Q}_{\rho})$$

We assume we know a degree 1 divisor class on C (to define ι), and generators of $J(\mathbb{Q})$.

Introduction

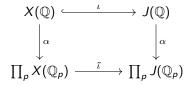

We assume we know a degree 1 divisor class on C (to define ι), and generators of $J(\mathbb{Q})$.

Basic Idea

If the images of α and $\tilde{\iota}$ do not intersect, then $X(\mathbb{Q})$ is empty.

Introduction

We assume we know a degree 1 divisor class on C (to define ι), and generators of $J(\mathbb{Q})$.

Basic Idea

If the images of α and $\tilde{\iota}$ do not intersect, then $X(\mathbb{Q})$ is empty.

These are infinite groups and sets, so the intersection can't be computed. Instead one works with a finite approximation.

$$X(\mathbb{Q}) \stackrel{\iota}{\longleftarrow} J(\mathbb{Q})/NJ(\mathbb{Q})$$

$$\downarrow^{\alpha} \qquad \qquad \downarrow^{\alpha}$$

$$\prod_{p \in S} X(\mathbb{Q}_p) \stackrel{\tilde{\iota}}{\longrightarrow} \prod_{p \in S} J(\mathbb{Q}_p)/NJ(\mathbb{Q}_p)$$

$$X(\mathbb{Q}) \stackrel{\iota}{\longleftarrow} J(\mathbb{Q})/NJ(\mathbb{Q})$$

$$\downarrow^{\alpha} \qquad \qquad \downarrow^{\alpha}$$

$$\prod_{p \in S} X(\mathbb{Q}_p) \stackrel{\tilde{\iota}}{\longrightarrow} \prod_{p \in S} J(\mathbb{Q}_p)/NJ(\mathbb{Q}_p)$$

Here N is a positive integer, and S a finite set of primes. Now we can compute the intersection. Heuristically, if $X(\mathbb{Q}) = \emptyset$, then the intersection will be empty if S and N are large enough.

Theorem (B.-Derickx, 2023)

Introduction

$$T_{10,000}(13) = \{17, 113, 193, 313, 481, 1153, 1417, 2257, 3769, 3961, 5449, 6217, 6641, 9881\}$$

 $T_{10,000}(18) = \{33, 337, 457, 1009, 1993, 2833, 7369, 8241, 9049\}$

 $X_1(16)$

The strategy is different here because every twist of $X_1(16)$ has a (cuspidal) rational point.

The strategy is different here because every twist of $X_1(16)$ has a (cuspidal) rational point. So many of the filters from the previous section go out the window.

As before, it's only the positive rank cases we need to worry about.

The strategy is different here because every twist of $X_1(16)$ has a (cuspidal) rational point. So many of the filters from the previous section go out the window.

As before, it's only the positive rank cases we need to worry about.

Proposition (B.-Derickx, 2023)

Let $K = \mathbb{Q}(\sqrt{d})$. If $\mathbb{Z}/16\mathbb{Z}$ arises as a possible torsion group over K, then $\operatorname{rk}(J_1^d(16)) > 0$.

Using the twisted winding element method from before, we compute the squarefree values of d with $|d| < 10{,}000$ for which ${\rm rk}(J_1^d(16)) > 0$; this yields 674 values.

We do a point search on these; 55 of them have extra points.

We do a point search on these; 55 of them have extra points. How to deal with the remaining 619 values?

Introduction

Theorem (Bruin-Stoll, souped-up version of Chevalley-Weil)

Every rational point on a hyperelliptic curve X lifts to a rational point on $some D \in TwoCoverDescent(X)$.
